

Abstract of the Disclosure

A door stop is in the form of a generally U-shaped base having a spacing member extending outwardly from one of the vertical walls of the base. The door stop is slidably mounted on the bottom of a door. The spacing member is of a length greater than the distance a doorknob or other door hardware extends from the door. As a result, when the door is swung to its open position the spacing member contacts the room wall to prevent the door hardware from contacting the room wall. A magnet could be mounted to the wall molding to magnetically hold the door in its open position where at least part of the door stop is made of metal.
